

Last week you were learning to scrap the data from web.

Now it is time to get the insights from the data you obtained!

You should do the following two tasks:

1. Follow the tutorial from lecture on your data in order to get familiar to Pandas functionality
2. Build the console app which will get the commands from user and perform manipulations on data. The results should be stored in new csv file.

For example: let's say you have a marathon dataset and you want to get only the females from a particular country who reached the finish line sorted by time. For that, you should write a logic in your program which should wait for the commands, i.g.: *get 'females' from 'Ethiopia' sortedby 'time'*

Be as creative as possible. Add as more functionality as you can imagine and implement according to Pandas flexibility.
